

# TEP for Inguinal Hernias

**Dr. Sanjiv Haribhakti**

*MS, DNB, MCh (GI)*

Chairman, Dept. of Surgical Gastroenterology  
Kaizen Hospital, Institute of Gastroenterology  
Ahmedabad, India.

# Inguinal Hernia Surgery

- Commonest general surgical operation
- Open Hernioplasty – Easiest, safest operation
- Laparoscopic Hernioplasty – advanced skills
- Adoption of Lap. Surgery – Low, Globally

# Lap. Inguinal Hernioplasty

- Constant Struggle
- Long Learning curve
- Increased risk of complications, Recurrence
- TEP or TAPP
- Frustrating, and stop Lap. Hernia Surgery

# Our Own Journey

- 18 years of Lap. Inguinal Hernia since 2000
- 95% Lap, 5% Open
- Long struggle with TEP
- Most cases TAPP
  
- Since 2017 March – Lap. e TEP
- No Looking back

# Choice of Operations

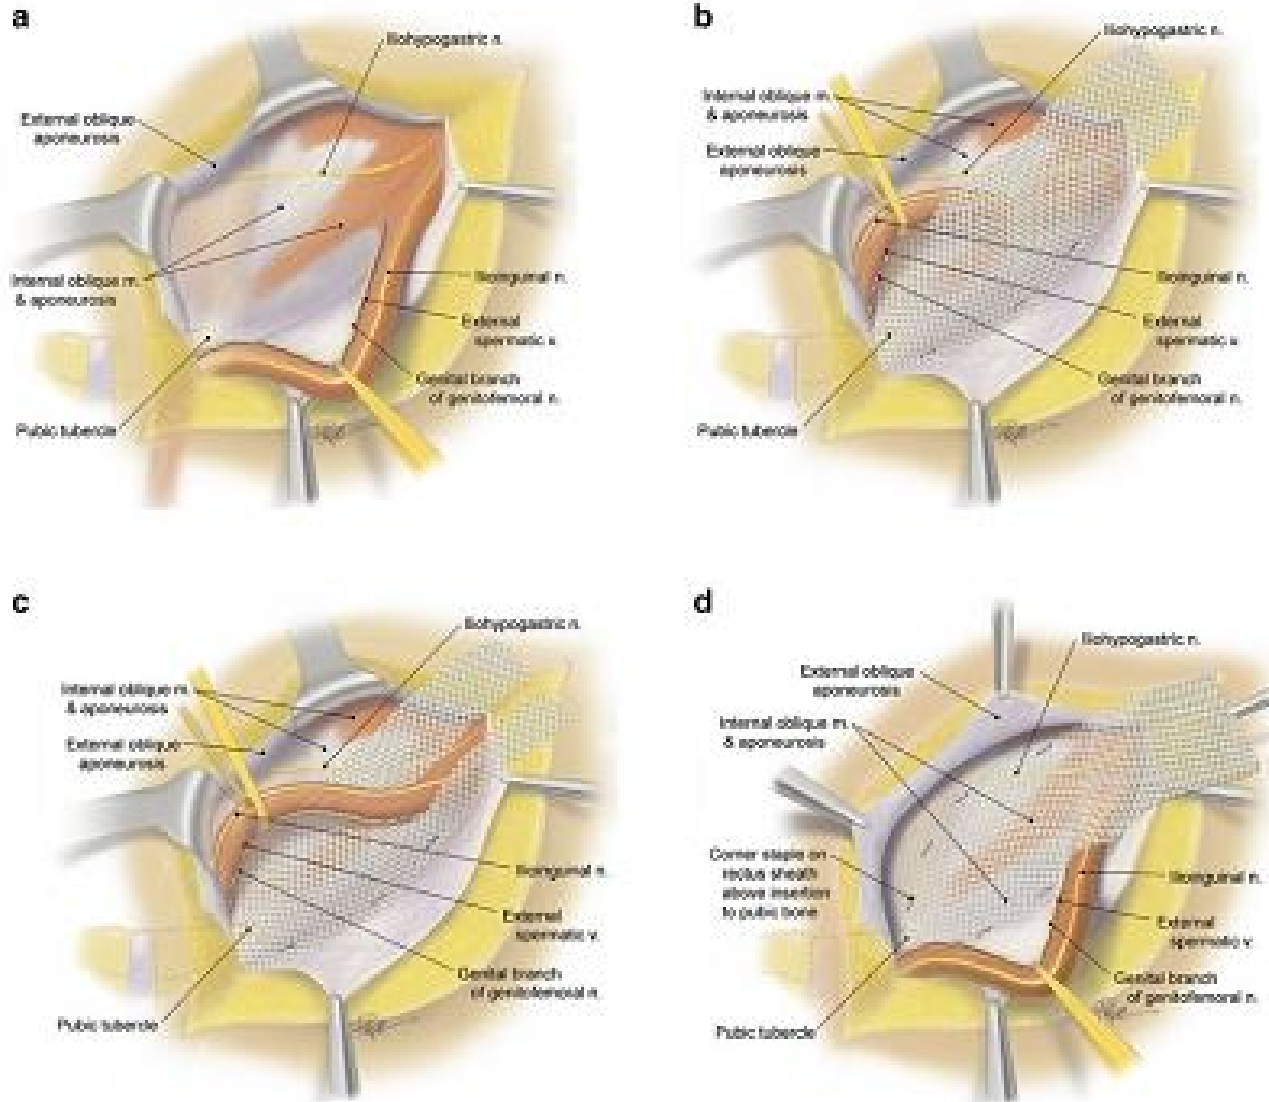

- Open
  - Lichtenstein's repair
  - Preperitoneal – McVay/Stoppa
  - Plug / Dual mesh - PHS
  - Shouldice repair
- Laparoscopic
  - TEP
  - TAPP
  - IPOM
  - e TEP

# What I am going to talk?

1. Open - Lichtenstein's repair in era of Lap. repair
2. Salient Anatomy
3. Lap. TEP & Lap. TAPP
4. Lap. e TEP
5. Video – Lap. E TEP

# Lichtenstein's repair

# Five concepts fundamental to Lichtenstein repair

1. Using a large sheet of mesh 15\*7 cm that extends 2 cm medially beyond the pubic tubercle, 3-4 cm above Hesselbach's triangle, and 5-6 cm lateral to the internal ring.
2. Crossing the tails of the mesh to avoid lateral recurrence.
3. Securing the upper edge of the mesh to the rectus sheath and internal oblique aponeurosis (avoiding the internal oblique muscle to prevent injury to the intramuscular segment of the iliohypogastric nerve) with two interrupted sutures, and the lower edge of the mesh to the inguinal ligament with one continuous suture.
4. Keeping the mesh in a slightly relaxed configuration to counteract the forward protrusion of the transversalis fascia when the patient stands up and, more importantly, to compensate for contraction of the mesh.
5. Visualizing and protecting the ilioinguinal, iliohypogastric, and genital nerves

# Lap. TAPP

# Why Choose Lap. TAPP ?

1. Enables a thorough intra-abdominal examination
2. Provides visualization of both inguinal regions for Occult hernias
3. Even without dissecting peritoneum-you can see the anatomy
4. Permits thorough exploration of the entire myopectineal orifice
5. Allows visualization of incarcerated hernias & strangulated tissue
6. Prior pelvic
7. Easier in females with indirect inguinal hernia, because the sac is frequently more intimately attached to the round ligament
8. Is easily taught and learned

# TEP

# Lap. TEP

## Advantages

1. Extraperitoneal approach
2. Less Visceral and vascular injuries
3. No suturing of peritoneal flap as in TAPP

## Disadvantages

1. Limited space for dissection and mesh placement
2. Restricted port placement
3. No Triangulation
4. Not reproducible in every case and thus
5. Difficulty in teaching and learning the technique
6. Poor tolerance to pneumoperitoneum

These disadvantages may explain the low implementation of the technique outside the circle of experts

# Lap. TAPP or TEP ?

	TAPP	TEP
Routine		✓
Prior Abdominal Surgery		✓
Bilateral Hernia		✓
Inguinoscrotal Hernia	✓	
Incarcerated Hernia	✓	
Hernia & Diagnosis	✓	
Recurrent Hernia	✓	
Hernia and Cholecystectomy		✓
Prior Preperitoneal Surgery	✓	
Contraindication - General Anesthesia		✓

# Lap. e TEP - Principle

- The preperitoneal space can be reached from virtually anywhere in the anterior abdominal wall.
- Preperitoneal space in lower abdomen is continuous with the retrorectus space beyond the arcuate line.

“e” stands for “extended view.”

# Salient features of eTEP technique

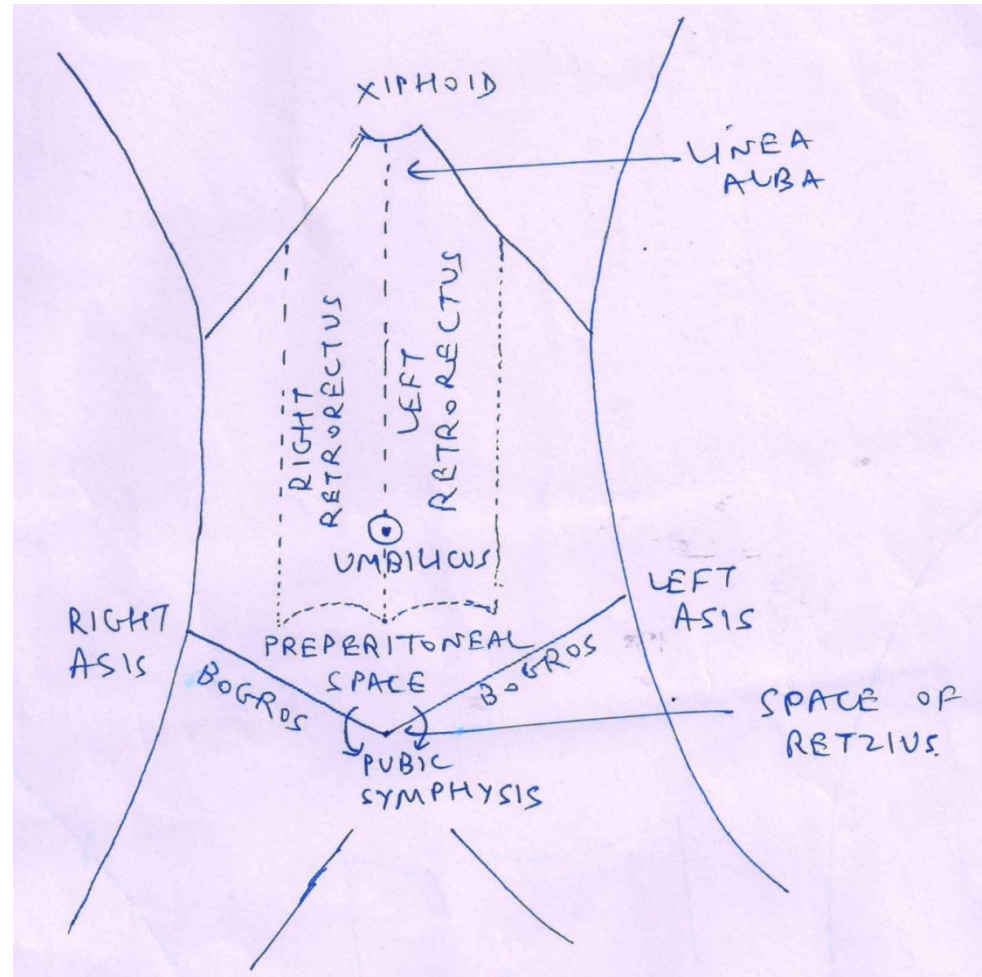

1. Fast and easy creation of the extraperitoneal space.
2. A large surgical field.
3. A flexible port setup adaptable to many situations.
4. Easy parietalization of the cord structures
5. Easier management of the distal sac in cases of large inguinoscrotal hernias.
6. Improved tolerance of pneumoperitoneum

## Ten Steps of Lap. E TEP

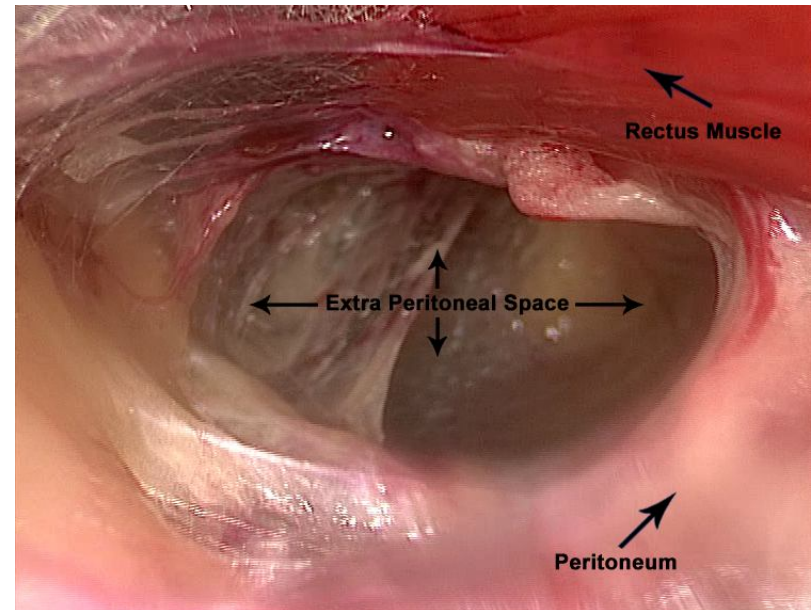

1. Retrorectus Space
2. Preperitoneal space
3. Space of Retzius
4. Space of Bogros
5. Direct Hernia Sac
6. Indirect Hernia Sac
7. Parietalisation of Cord
8. Lateral space dissection
9. Mesh placement 15 \* 15
10. Mesh Fixation

## Anatomical concept

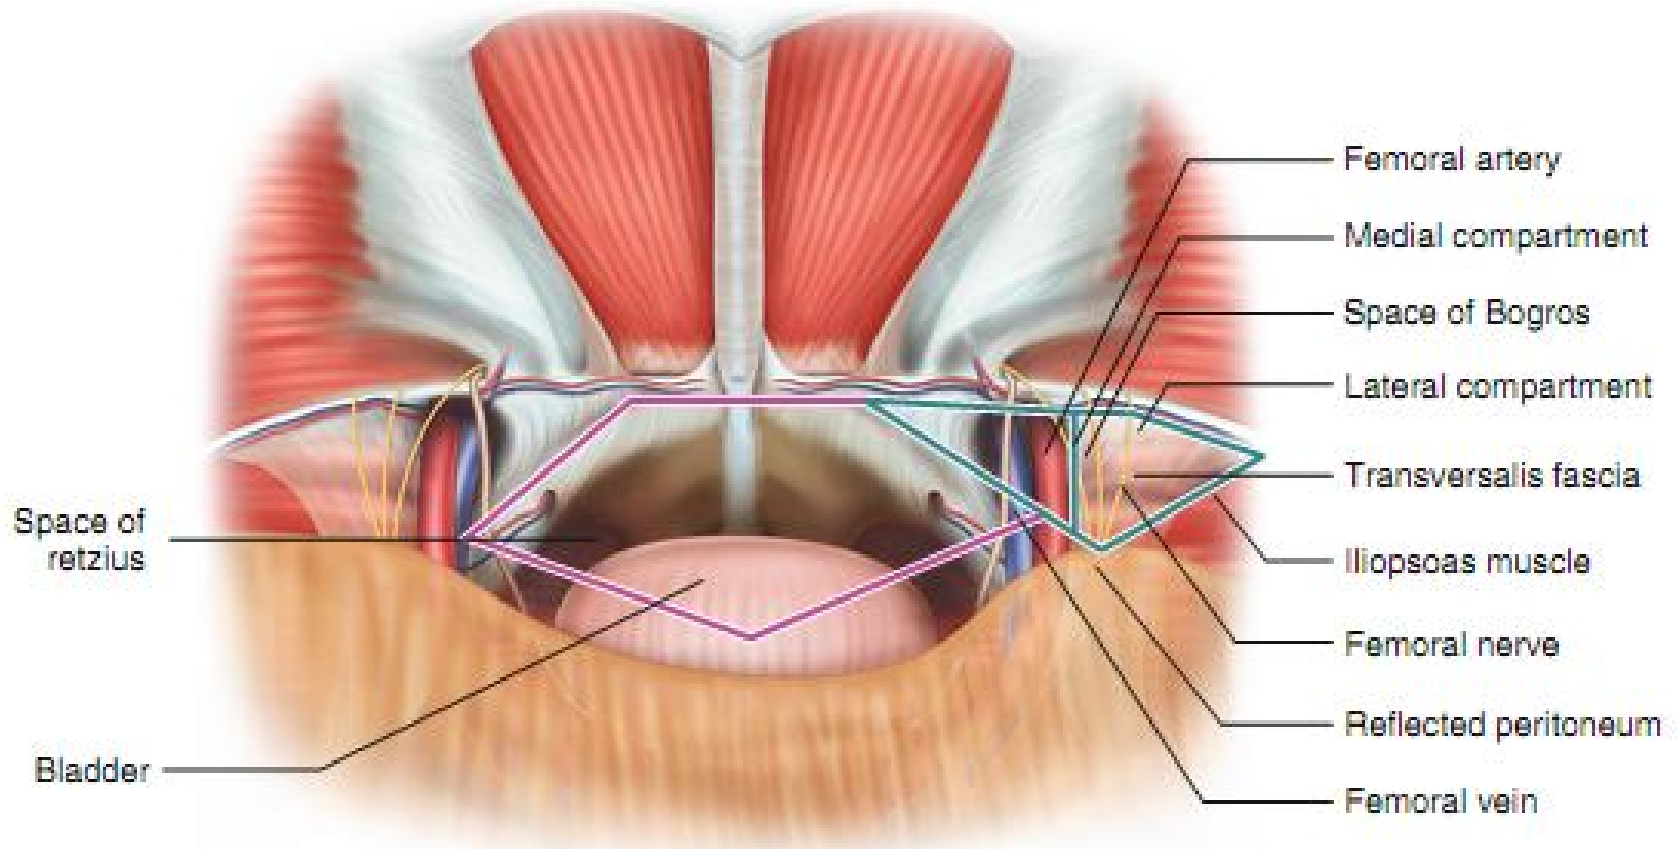

# Arcuate Line of Douglas

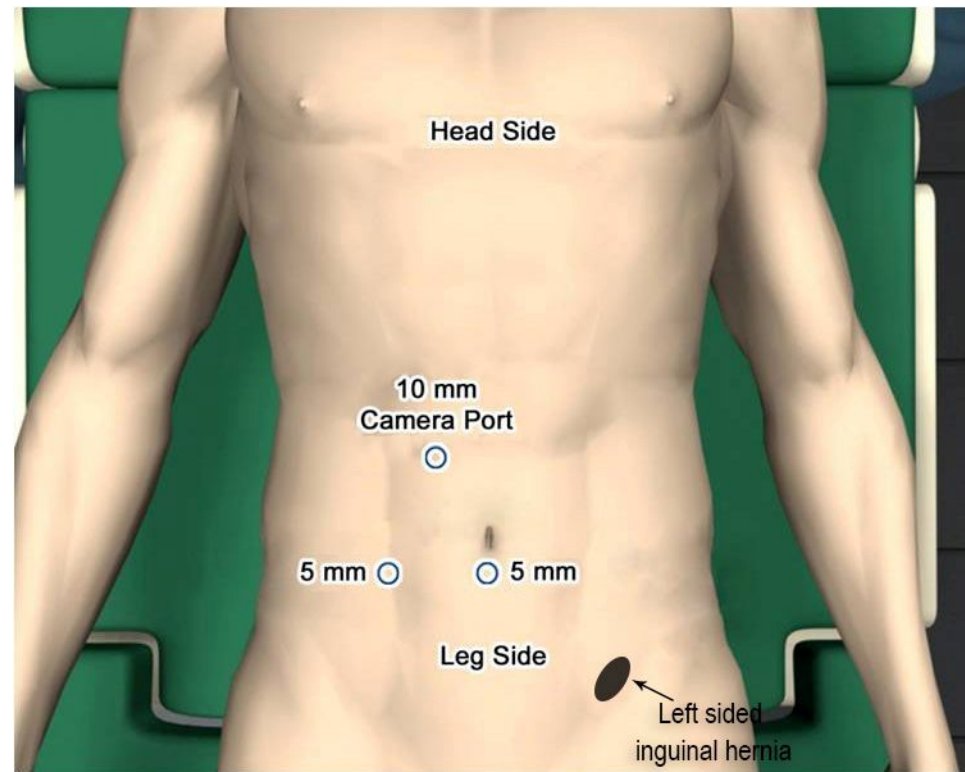

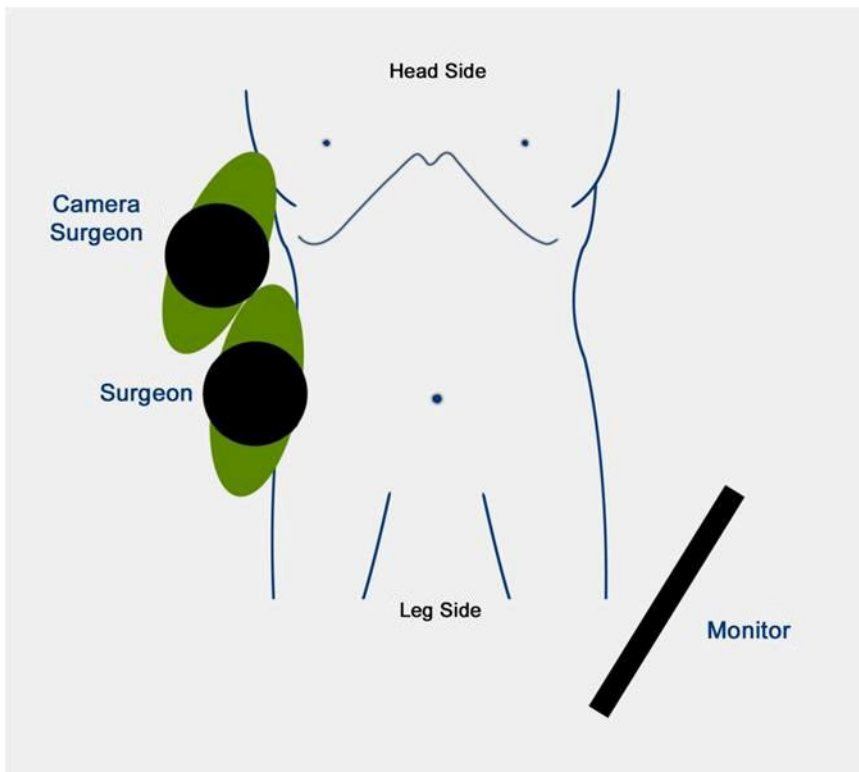

- Posterior rectus sheath ends
- Midway between umbilicus & pubic symphysis
- Below the Arcuate line, Rectus muscle is covered by Fascia Transversalis & Peritoneum
- Inf. Epigastric vessels pierce RA
- Can be cut laterally to gain access to lateral spaces

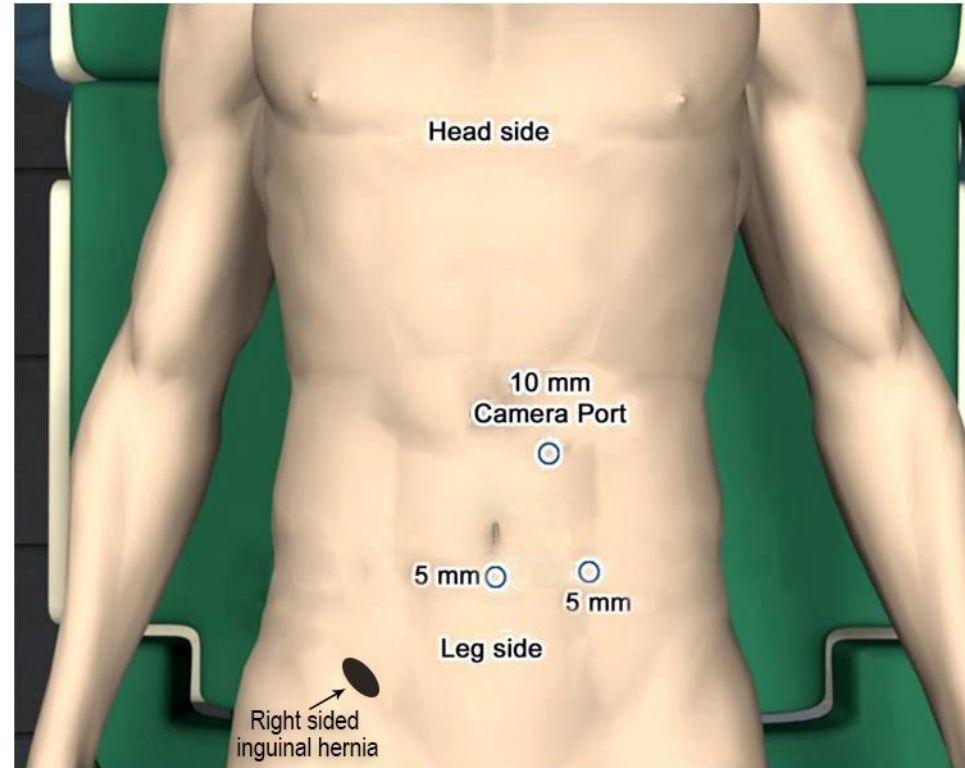

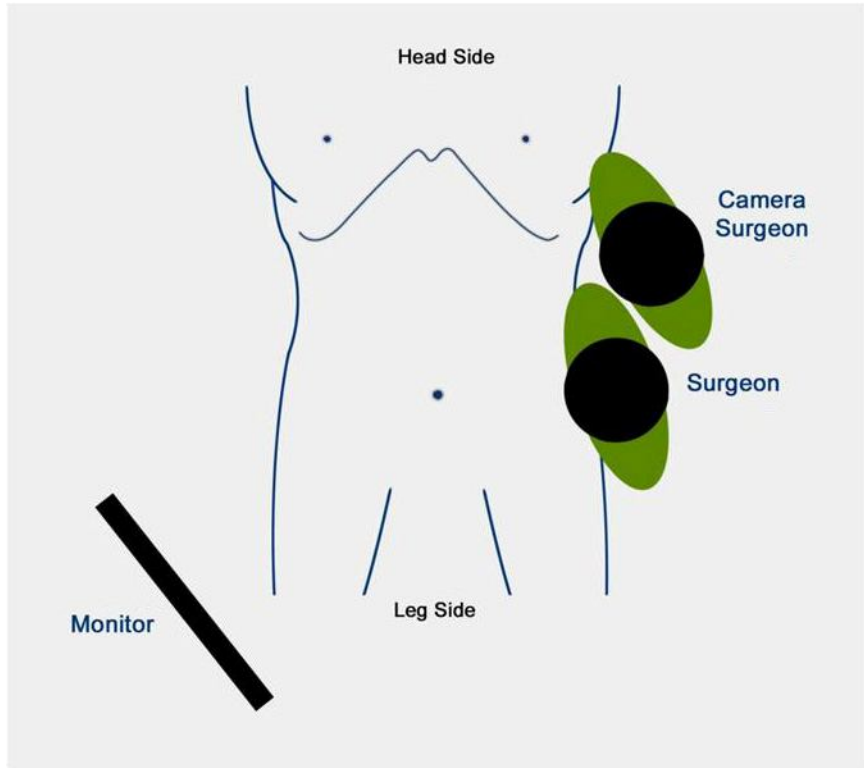

# EP Spaces of Retzius & Bogros

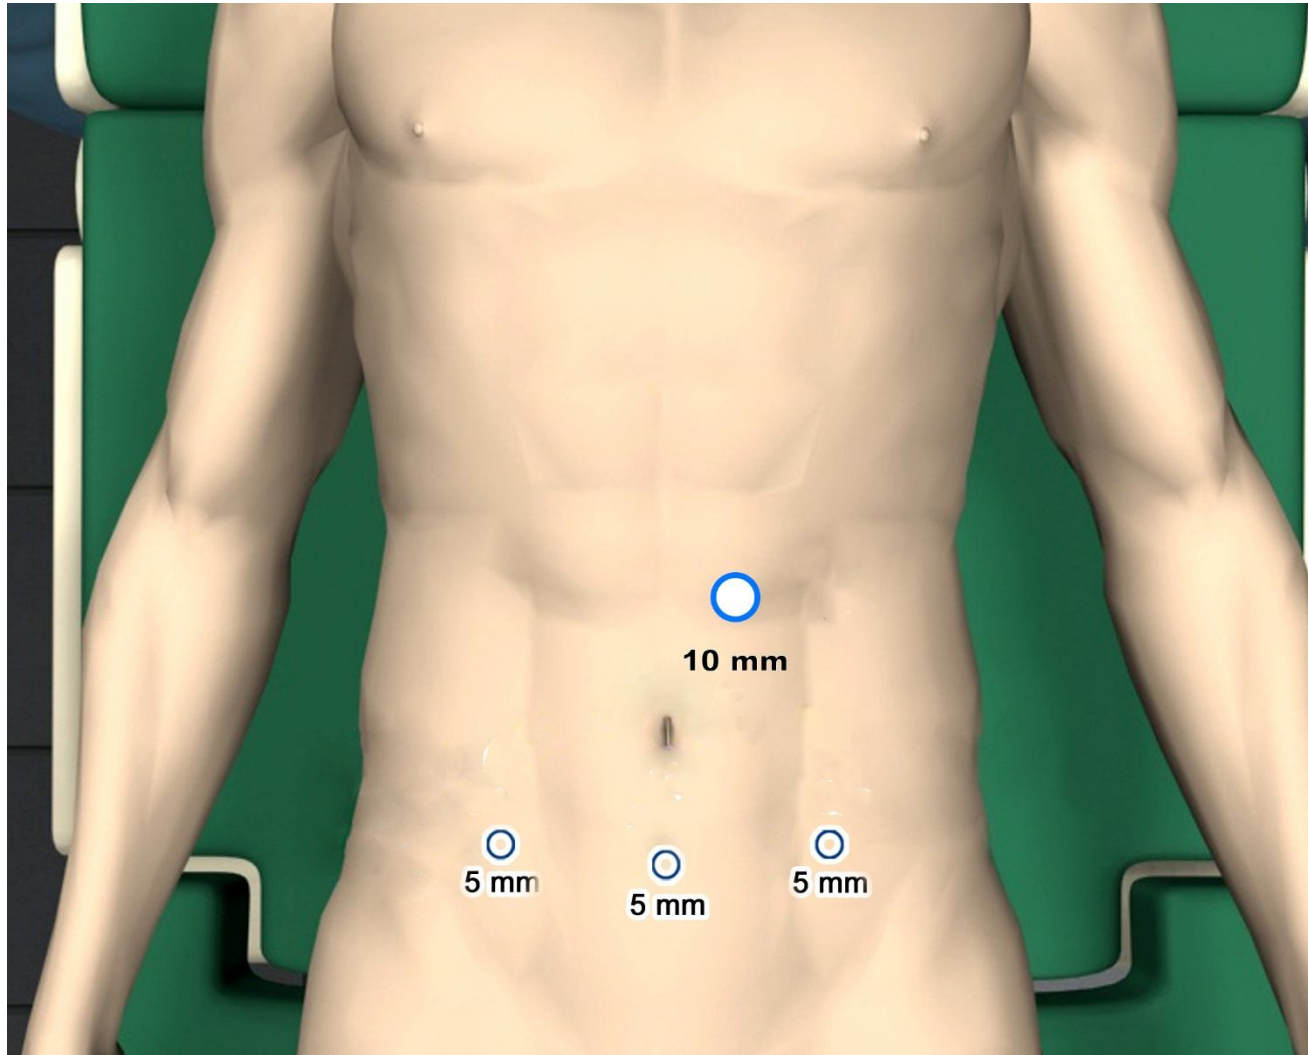

# eTEP – Port & Surgeon Position for Left Side

# eTEP – Port & Surgeon Position for Right Side

# Port placement for bilateral hernia

# Indications of e TEP

We use eTEP technique to repair most cases of inguinal hernias; however, there are cases for which eTEP is especially useful:

1. For the new surgeon: eTEP is easier to learn & master
2. Large inguinoscrotal, sliding, or incarcerated hernias
3. Obese or post-bariatric patients
4. When distance between umbilicus and pubic tubercle is short
5. In patients with previous pelvic surgeries.

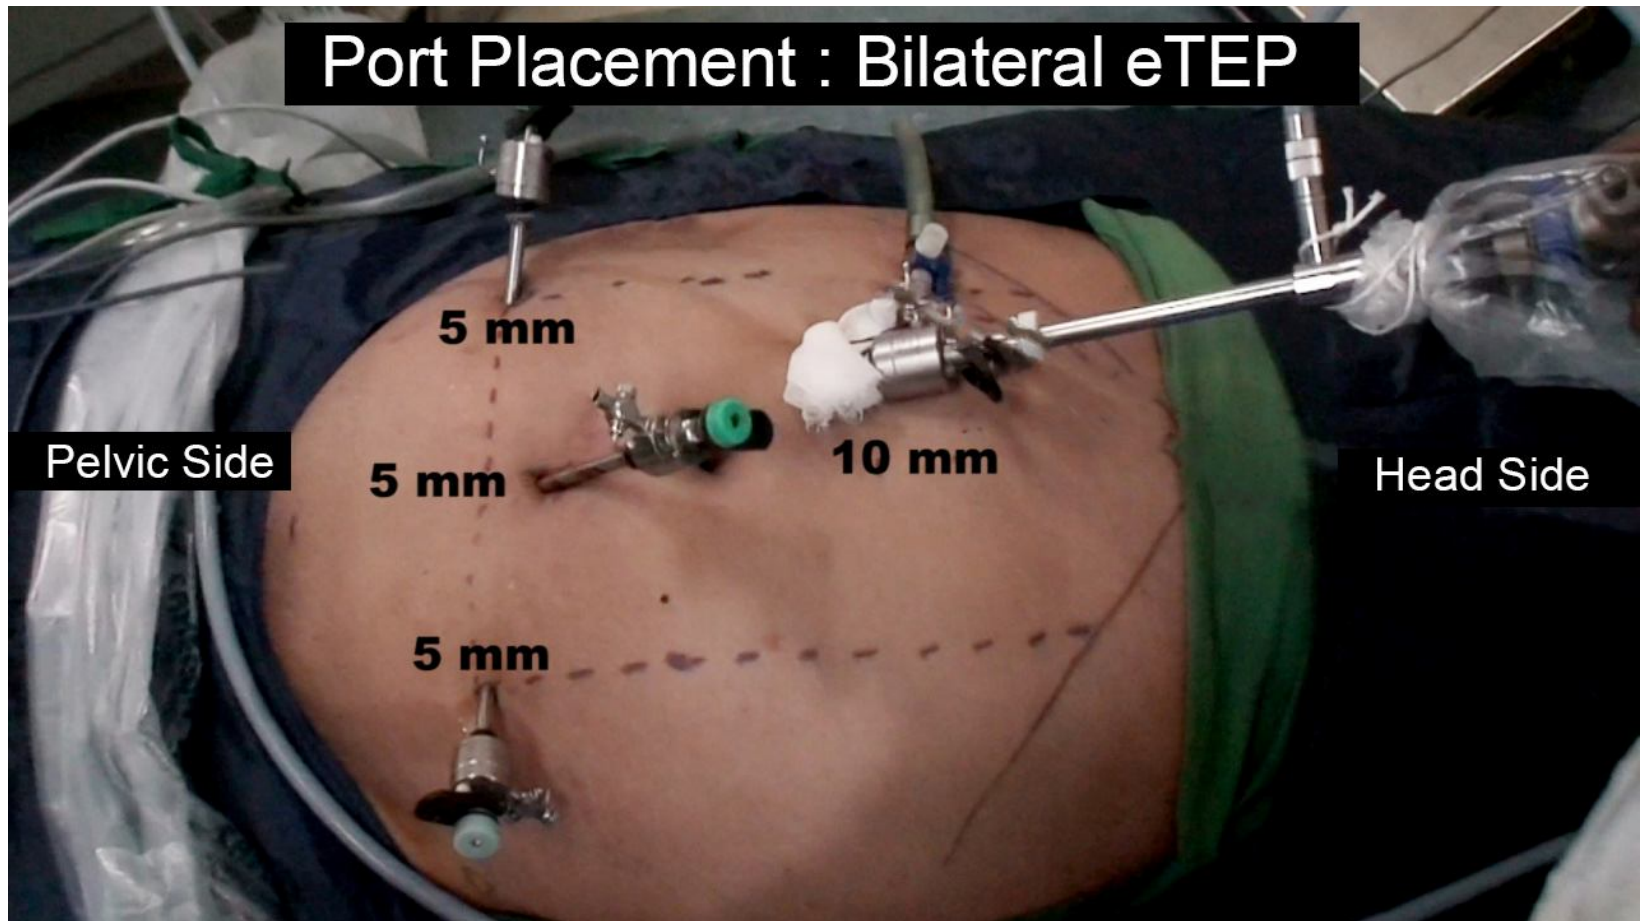

# Key Technical Aspects of eTEP High Camera Port Placement

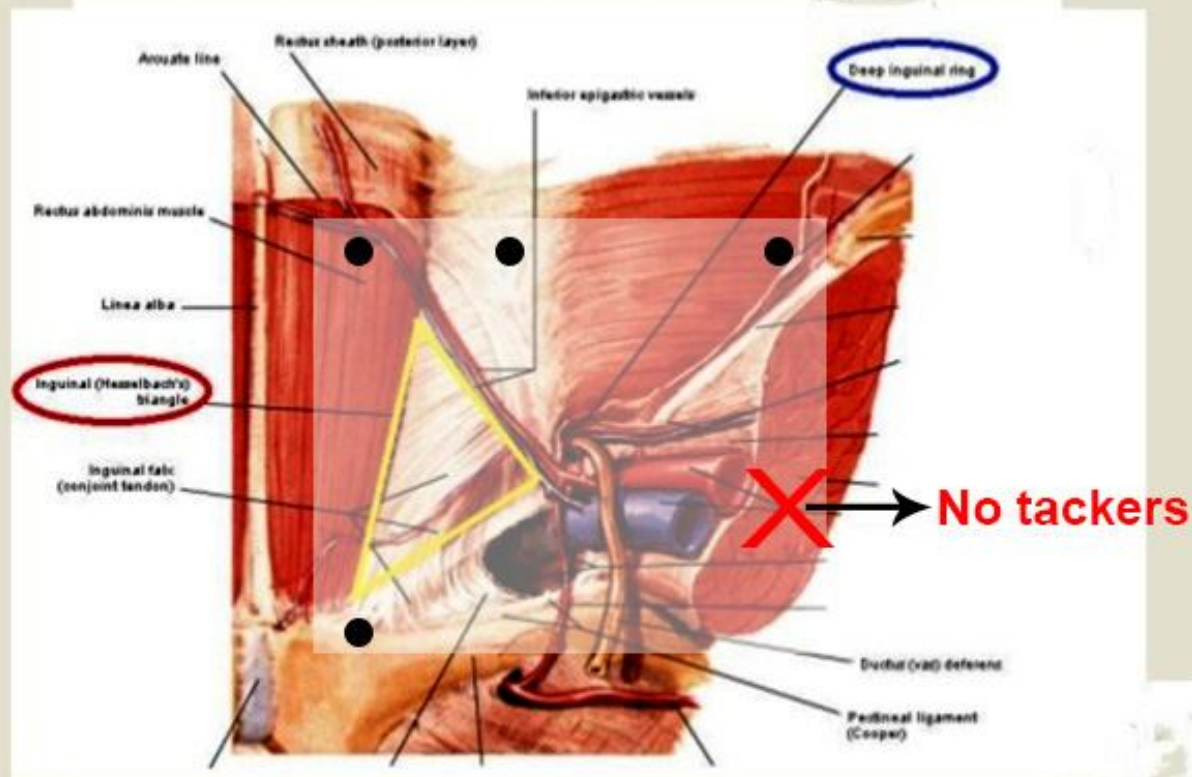

# Key Technical Aspects of eTEP High Camera Port Placement

## Port Placement : Bilateral eTEP

# Mesh Fixation - Tackers

## Anatomy Review

# Troubleshooting

1. Pneumoperitoneum - 3 mm trocar / verres
2. Lateral Space creation - Division of Douglas line

# Special situations

- Large inguinoscrotal hernia
- Incarcerated or strangulated hernia
- Morbid Obesity
- Previous Pfannensteil incision
- Prior lower abdominal surgery
- Recurrent hernias
- Bilateral hernias

# Mix of Recurrence

- After Open hernia surgery - Lap. TEP / TAPP
- After Lap. Surgery - Lap. TAPP / Open

# Bilateral Hernias

- Laparoscopy is better than bilateral open surgery
- For open - stoppa repair may be preferable

# Postop. Groin Pain

- Preoperative groin pain must be evaluated
- Nerve entrapment is a major cause
- Analgesics, Anti-inflammatory
- Neural blocks or Neuroablative procedures
- Lap TAPP exploration and removal of tackers
- Triple Neurectomy as a last option

# The enhanced view–totally extraperitoneal technique for repair of inguinal hernia

Jorge Daes

Surg Endosc (2012) 26:1187–1189

36 pts

## Conclusions

Our initial experience with the e-TEP technique has been satisfactory. We have had no conversions in spite of the difficult cases selected. There were no major complications, and functional results were excellent. We believe this modification has a place in the armamentarium for hernia repair. It is especially useful for repair of large inguinal hernias, inguinoscrotal hernias, incarcerated hernias, bilateral hernias, in obese patients, and in patients with a short distance between the umbilicus and the pubic tubercle.

# eTEP – Our experience

- From March 17 to August 18 – total 40 pts
- 24 bilateral , 16 unilateral
- 15\*15 mesh on one side
- Single 30\*15 mesh for bilateral in 8 cases
- Op. time – 50 mts(1), 85 mts(2)
- No major morbidity or mortality
- 2 conversions to TAPP
- 6 pts. developed Seroma self resolving
- 1 recurrence

# eTEP – Our experience

- Very good space, easy to learn
- Good triangulation and suturing
- Large inguinoscrotal hernias
- Time taken for surgery comparable to TEP/TAPP
- Large lightweight mesh, fixed with tackers
- Rare conversion to TAPP
- No major complication
- One recurrence till date , needs longer follow up

# eTEP – The future?

- The 3<sup>rd</sup> Alternative
- Potential to become Gold standard for Lap. Hernia surgery due to
  - Ease of surgery
  - Good space
  - Extraperitoneal
  - Large Mesh
  - Reproducible
  - Easier to Teach and Learn
  - Tackle Large Hernias
